* COMMENTS → Comments are the part of programming but they never part of Execution. They used to understand the flow of programming or some critical logics

Types of comments :-

→ Single line comment

** Its single line comment

→ multiline comment

''' its multiline comment '''

""" its multiline comment """

* KEYWORDS → Keywords are the predefined words to perform a specific task.

Ex. if, for, else, break....

→ These words are not used as Identifiers. (variable, function name....)

[True, False, none, and, or, not, in, is, if, else, elif, for, while, break, continue, pass, def, return, lambda, class, yield, global, nonlocal, try, expect, finally, raise, assert, import, from, as, with, del, async,]

* VARIABLES :- → Variables are place holders which holds any kind of value and they Represented by variable name.

Rules for variables declaration:

1) Variable can be uppercase (or) Lower case
2) It can be single alphabet or string or alpha Numeric.
3) We can use dual words as single variable but they should seperated by _ (underscore).
4) They cant be start with Numbers.
5) They cant use any special characters apart from (_)
6) We cant seperate them by space.

Valid variable declaration:

* A = 6
* a = 10
* place = "chennai"
* stu_name = "simbu"
* NUM1 = 50
* NUM2 = 70
* _stu_id_ = 2391

Invalid Variable declaration:

* stu phone num = 9943187274
* emp@ name @ comp = "sagar"
* 1num = 100

Programming Data Types

It Represented Kind of data.

Single Value data type:-

int, float, boolean, complex, str.

multivalue data type :-

list, tuple, set, dictorary, str.

ex:-

```
n=5                    name = "pratheep"
type(n)                type(name)
o/p                    o/p
  int.                   str.

n1= 5,6                val = {1:1, 2:"hi", 3:8:4}
type(n1)               type(val)
o/p                    o/p
  tuple                  dict
```
